DTAC LOADED AMMO

HIGH-PERFORMANCE PRODUCTS engineered by 11-time National High Power Champion David Tubb

INFORMATION OVERVIEW

DTAC Loaded Ammo

A new standard for excellence. DTAC ammunition is engineered to be capable of firing a 10-inch vertical 10-shot group at 1000 yards.

The question was easy to ask and easy to answer: How can we make the best ammunition on the market? Start with carefully

chosen and segregated components, develop a proven load combination that maximized both velocity and accuracy, and then assemble each and every round as if it was to fire the last “x” needed to win a national championship, or as if someone’s “shot of a lifetime” in the field depended on its performance.

DTAC ammunition is produced to a standard previously unavailable from the ammunition manufacturing industry. All DTAC Loaded Ammo is manufactured following strict quality control guidelines by people who know and care about extreme rifle performance.

DTAC offers a standard of excellence equivalent to the most meticulously prepared handloaded ammunition, including select extruded propellants chosen for temperature insensitivity, precisely weighed

propellant charges, concentricity tolerance, uniform ballistic performance, and detailed component preparation.

DTAC IIP products won't ever be for “everyone.” They are engineered to provide solutions for the serious precision rifleman and competitive shooter – people who can understand and appreciate the differences found in DTAC offerings. Mostly, DTAC is for those who not only see these differences, but who know in a heartbeat that they have chosen wisely.
